Much has happened to certification and to human factors during the past few years. In this volume, the editors and other specialists discuss the topic of human factors applied to certification. They focus on core topics in the certification process that have emerged in the study of product certification in high-tech industries. The editors' purpose is to document advances in the study of certification processes defined largely by the 1993 international conference on the application of human factors principles to the study of product certification in man-machine systems. Although the book focuses mostly on certification in large, man-machine systems, such as aeronautics, its principles also apply to other high tech industries, such as medicine and computers. An introductory paper and a group of papers presenting propositions and philosophies about human factors contribute to a framework for human factors certification. The papers in this volume: * adopt a more direct approach to certification activities, * deal with aspects of human-machine integration, * address topics that should feature in any established human factors certification of advanced aviation systems, * use ideas that already exist in aviation as a basis for discussing certification issues, * consider issues that arise in the certification of complex future systems, and * describe some current characteristics of human factors as a discipline that would influence its application to certification.

Climate change policy inevitably has two core components: the goals, and the means chosen to pursue those goals. Decisions on goals and means necessarily have distributional consequences. Any policy choice generates winners and losers. While this outcome cannot be avoided - even doing nothing leads to distributional consequences - policymakers can, through the choice, design and implementation of policies, shape to some extent the distribution of the burdens of mitigation and adaptation to climate change. In greater depth than any previous legal study in the field, this book deals with the way in which the European Union (EU) has dealt with climate change and with the distribution of the benefits and costs of climate change mitigation policies among affected parties. With extraordinary thoroughness the author assesses the legality of choices made (particularly concerning mitigation targets and timelines), and examines the role that legal principles can play in the adoption, interpretation, and judicial testing of distributional choices. His analysis of the tension between such choices and EU law is bolstered by an exploration of emerging legal principles which could provide additional guidance in this challenging and controversial area. Among the core issues dealt with are the following: relationship among mitigation, adaptation, and sustainable development; regulations as means to make distributional choices distributional choices between generations and the principle of intergenerational justice distributional choices concerning firms and individuals the participation of affected parties in distributional choices access to justice in EU courts to challenge violations of procedural environmental rights the role of legal principles in making, evaluating and testing distributional choices the principle of proportionality with its tests of appropriateness and necessity; the principle of equality; the precautionary principle; the principle of prevention; the polluter pays principle; A concluding chapter offers deeply informed recommendations regarding the design of EU climate change law, including a preliminary assessment of EU wide personal carbon trading. In its insightful illumination of how the inevitable trade-offs, weaknesses, inconsistencies and ambiguities in the way law deals with distributional choices renders them vulnerable to external pressures, this book will be of enormous value to regulators and policymakers concerned with effective, efficient, and fair climate change measures. As a critical assessment of existing EU climate change laws and policies, and as a systematic analysis of the problem of burden sharing, this book will also prove highly valuable to academics in environmental fields of study.

This textbook presents an introduction to fundamental concepts of continuous-time and discrete-time signals and systems, in a self-contained manner.

In this book, modeling and control design of electric motors, namely step motors, brushless DC motors and induction motors, are considered. The book focuses on recent advances on feedback control designs for various types of electric motors, with a slight emphasis on stepper motors. For this purpose, the authors explore modeling of these devices to the extent needed to provide a high-performance controller, but at the same time one amenable to model-based nonlinear designs. The control designs focus primarily on recent robust adaptive nonlinear controllers to attain high performance. It is shown that the adaptive robust nonlinear controller on its own achieves reasonably good performance without requiring the exact knowledge of motor parameters. While carefully tuned classical controllers often achieve required performance in many applications, it is hoped that the advocated robust and adaptive designs will lead to standard universal controllers with minimal need for fine tuning of control parameters.

Emphasizing problem-solving skills throughout this very successful book, Stephen Chapman introduces the MATLAB® language and shows how to use it to solve typical technical problems. The book teaches MATLAB® as a technical programming language showing students how to write clean, efficient, and well-documented programs. The aesthetic nature and purposes of computer culture in the contemporary world are investigated in this book. Sean Cubitt casts a cool eye on the claims of cybertopians, tracing the globalization of the new medium and enquiring into its effects on subjectivity and sociality. Drawing on historical scholarship, philosophical aesthetics and the literature of cyberculture, the author argues for a genuine democracy beyond the limitations of the free market and the global corporation. Digital arts are identified as having a vital part to play in this process. Written in a balanced and penetrating style, the book both conveniently summarizes a huge literature and sets a new agenda for research and theory.

For core courses in Electric Machinery. Focuses on all aspects of steady-state performance, control and applications. (vs. Fitzgerald,

Chapman, Nasar, Lindsay/Rashid).

The performance of software systems is dramatically affected by how well software designers understand the basic hardware technologies at work in a system. Similarly, hardware designers must understand the far-reaching effects their design decisions have on software applications. For readers in either category, this classic introduction to the field provides a look deep into the computer. It demonstrates the relationships between the software and hardware and focuses on the foundational concepts that are the basis for current computer design.

This book is intended for a course that combines machinery and power systems into one semester. It is designed to be flexible and to allow instructors to choose chapters a la carte, so the instructor controls the emphasis. The text gives students the information they need to become real-world engineers, focusing on principles and teaching how to use information as opposed to doing a lot of calculations that would rarely be done by a practising engineer. The author compresses the material by focusing on its essence, underlying principles. MATLAB is used throughout the book in examples and problems.

Beset by war, disease, famine, human rights abuses, and numerous other problems, Africa today is a continent in need of good leadership. Many people believe the only way Africa will be able to solve its many challenges is by uniting the more than 50 nations on the continent. To that end, the African Union was formed in 2002 as a successor to the largely ineffective Organization of African Unity. The purpose of the African Union is to turn Africa into a political and economic power. The new organization faces many challenges, and the solutions to Africa's problems will not be easy to find. Yet on its shoulders the African Union carries the hopes and dreams of a continent.

The book on The General Theory of Electrical Machines, by B. Adkins, which was published in 1957, has been well received, as a manual containing the theories on which practical methods of calculating machine performance can be based, and as a text-book

for advanced students. Since 1957, many important developments have taken place in the practical application of electrical machine theory. The most important single factor in the development has been the increasing availability of the digital computer, which was only beginning to be used in the solution of machine and power system problems in 1957. Since most of the recent development, particularly that with which the authors have been concerned, has related to a. c. machines, the present book, which is in other respects an up-to-date version of the earlier book, deals primarily with a. c. machines. The second chapter on the primitive machine does deal to some extent with the d. c. machine, because the cross-field d. c. generator servesas an introduction to the two-axis theory and can be used to provide a simple explanation of some of the mathematical methods. The equations also apply directly to a. c. commutator machines. The use of the word 'general' in the title has been criticized. It was never intended to imply that the treatment was comprehen sive in the sense that every possible type of machine and problem was dealt with.
